

std::exception

```
classDiagram
    class std_exception["std::exception"]
    class bank_account_money_less_than_zero["bank::Account::moneyLessThanZero"]
    bank_account_money_less_than_zero --|> std_exception
```

The diagram illustrates an inheritance relationship. At the top is a class box for `std::exception`, which is divided into three horizontal compartments. The bottom compartment is empty. Below it is a class box for `bank::Account::moneyLessThanZero`, which is shaded gray and also divided into three horizontal compartments. The top compartment contains the text `bank::Account::moneyLessThanZero`, the middle compartment is empty, and the bottom compartment contains `+ what()`. A blue arrow with an open triangular head points from the top of the `bank::Account::moneyLessThanZero` box to the bottom of the `std::exception` box, indicating that `bank::Account::moneyLessThanZero` inherits from `std::exception`.

bank::Account::moneyLess
ThanZero

+ what()
