

std::exception

```
classDiagram
    class std_exception["std::exception"]
    class bank_ATM_accountTypeNotDefined["bank::ATM::accountTypeNot Defined"]
    bank_ATM_accountTypeNotDefined --|> std_exception
```

The diagram illustrates an inheritance relationship. At the top is a class box for 'std::exception', which is divided into three horizontal sections: the top section contains the class name, and the two bottom sections are empty. Below it is a class box for 'bank::ATM::accountTypeNot Defined', which is divided into three horizontal sections: the top section contains the class name, the middle section is empty, and the bottom section contains the method '+ what()'. A blue arrow with an open triangular head points from the top of the 'bank::ATM::accountTypeNot Defined' box to the bottom of the 'std::exception' box, indicating that 'bank::ATM::accountTypeNot Defined' inherits from 'std::exception'.

bank::ATM::accountTypeNot
Defined

+ what()
