

std::exception

```
classDiagram
    class std_exception["std::exception"]
    class bank_account_money_invalid["bank::Account::moneyInvalid InAccount"]
    bank_account_money_invalid --|> std_exception
```

The diagram illustrates an inheritance relationship. At the top is a white box representing the base class 'std::exception', which is divided into three horizontal sections. The top section contains the text 'std::exception', while the two sections below it are empty. At the bottom is a grey box representing the derived class 'bank::Account::moneyInvalid InAccount', which is divided into three horizontal sections. The top section contains the text 'bank::Account::moneyInvalid InAccount', the middle section is empty, and the bottom section contains the text '+ what()'. A blue arrow with an open triangular head points from the top edge of the grey box to the bottom edge of the white box, indicating that 'bank::Account::moneyInvalid InAccount' inherits from 'std::exception'.

bank::Account::moneyInvalid
InAccount

+ what()
